Hotspot

What Is Hotspot

A mobile app built on the IOTA network to enable and facilitate peer to peer Wi-Fi. The goal is to have cheap and accessible Wi-Fi available all across the globe.

Problem: People have a plethora of Wi-Fi available and do not use their full allocated bandwidth every month.

What Is Hotspot

A mobile app built on the IOTA network to enable and facilitate peer to peer Wi-Fi. The goal is to have cheap and accessible Wi-Fi available all across the globe.

Solution: Our platform allows people to monetize and share their network.

What Is Hotspot

By using blockchain we've created a seamless decentralized way to setup Wi-Fi networks.

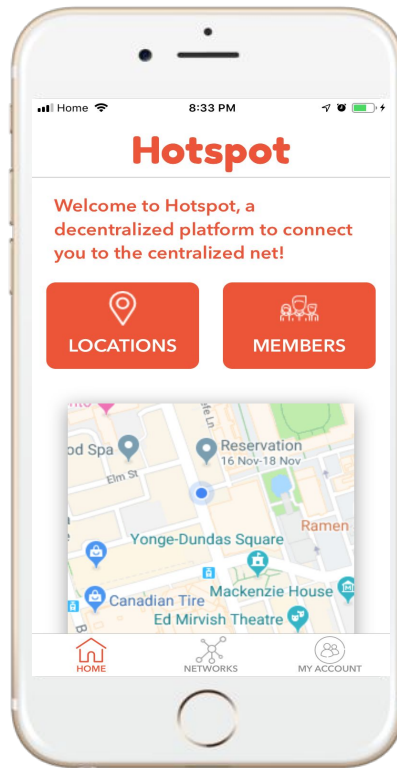

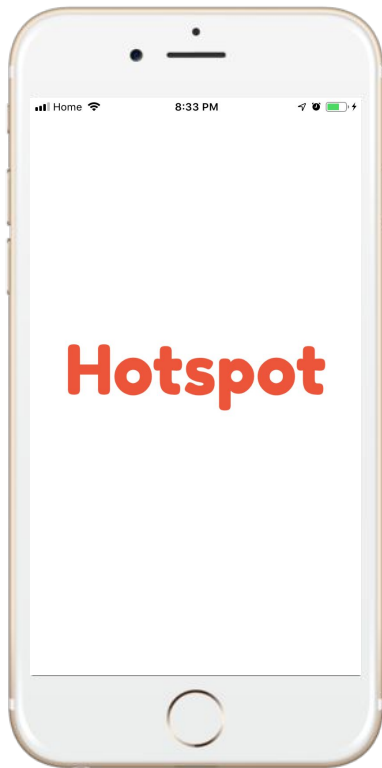

How It works

People in the community can use an application to create a guest subnet on their router using our desktop wallet and software.

When someone wants access to the network they can send the owner of the network a token amount to gain access for a limited amount of time.

Demo

Business Model

Initial

Transaction fee on each usage

Free distribution of routers for 1,000 users.

Sponsorship with different companies to buy and use routers.

Long Term

We launch our own network to run on the token and founding team holds an amount. People who share and act as ISPs get tokens.

Consumer has the ability to share any mobile data or Wi-Fi they have.

Competition

- Open Garden, similar idea but has centralized business model requiring hardware.
- Ammbr, only in India.
- Lot's of other ICOs trying to do mesh networks and p2p Wi-Fi

Hotspot

Peer to Peer Decentralized Wi-Fi

A woman with long blonde hair, wearing a light blue jacket and a red backpack, is leaning forward and pointing her right index finger at a red information kiosk. The kiosk has a map of Asia at the top, a 'Hop On - Hop Off' bus schedule section, and a list of locations including Plaza Europa, Plaza, and Estación. The background is a park with trees and a street with parked cars.

Thank You!
